

Planning the search feature for task 2.7; recipe app.

I would like my search feature to be able to allow users to search with partial keywords (e.g., “Choco” should return “Chocolate Cake”), using Django’s `icontains`. The search bar will allow users to search for titles and ingredients using partial or complete keywords.

The search functionality will be located on the recipe list screen (`recipes_list.html`), and will filter the recipe cards in the list based on user input.
